FOREWORD

TÜSIAD, stands for "Türk Sanayicileri ve İşadamları Derneği" ("The Turkish Industrialists' and Businessmen's Association") which was founded in 1971 by a group of leading names in Turkish industry and business. TÜSİAD is an independent, non-profit institution whose primary purpose is to promote public welfare. TÜSİAD is scientific and objective in its researches. It is emphasised that this study does not necessarily reflect the views of the TÜSİAD members nor, of course, is it to be considered in any way whatever to be an official publication.

The eighth issue of TÜSİAD Quarterly Economic Survey is prepared by utilising the most recent data and estimations available in January, February and March 1996 by Economic Research Department.

EFFECTIVE MEASURES MUST BE TAKEN IN 1996 THAT WILL RESTORE THE BALANCES IF SUSTAINED GROWTH IS TO BE ATTAINED.

Repeated deviations from the stabilization program in 1995 have brought about significant increases in foreign trade and budget deficits, halted the process of a meaningful and lasting reduction in the inflation and interest rates, and prevented the economy from moving forward onto a path of stable growth as required by the Customs Union. In 1996, if the necessary measures are not taken to restore the macroeconomic balances, and if in particular financial discipline is not rigorously maintained, the government's goals for this year will not be achieved and the endemic instability in the macroeconomic structure will continue unabated.

The economy, which had contracted by 6.1 percent in 1994, grew at a rate of 8.1 percent in 1995. However, despite the fast growth in 1995, GNP at constant prices was only 1.5 percent higher than its level in 1993. The reduction in per capita income which was brought about by the crisis of 1994 has not yet been offset and industrial production has not yet reached its long-term growth trend. Attainable medium term targets must be formulated, and monetary and financial policies consistent with these targets must be put into action without delay, for being able to check the excessive fluctuations in economic growth and to sustain a stable growth rate.

In a scenario of stable growth for the 1996-1998 period, included as an appendix with this report, it is shown that in order to arrive at a 6 percent growth rate and cut down the inflation rate to 40 percent in the span of three years, it is imperative to increase the budget revenues, decrease the budget deficit, diminish the rate of increase of the reserve money, and balance the overexpanded foreign trade deficit by means of the increases in the invisible revenues.

If the required structural transformations are not immediately set in motion, the predicted increase in the budget deficit for the year 1996 and its settlement by short-term domestic borrowing and monetary financing will result in increases in the rates of interest and inflation.

The deterioration in the foreign trade deficit will push up the current account deficit to alarming levels, if the increase in invisibles income is not sustained.

The result of the increasing budget and current account deficits, rising inflation rate, and unchecked real interest rates, will be a postponement, once again, of the goal of increasing Turkey's competitiveness and creating more employment.

Deviation from the stabilization program has brought about in the last quarter a growth rate higher than expected.

In 1995 the 8.1 percent GNP growth rate was higher than expected. TÜSİAD's prediction of the GNP growth rate was 7.4 percent for 1995 and 6.0 percent for the last quarter of the year. The reason for the higher-than-expected 7.7 percent GNP growth rate in the last quarter of 1995 was the rapid increase in the fixed capital investments of the private sector. As a result of these developments, the earlier prediction of 3.1 percent GNP growth rate for the first quarter of 1996 was revised up to 4.6 percent.

According to the production-based GNP data, the industrial sector achieved the highest growth rate with 12.1 percent. The trade sector grew at a rate of 11.6 percent and the rate of growth in the transportation sector was 5.9 percent. 1995 was an unfavorable year for the construction sector. The construction sector attained a positive growth rate only in the second quarter of the year, while it suffered a contraction of 11.1 percent in the first quarter and of 4.7 percent in the whole year. The agricultural sector shrank by 3.0 percent in the last quarter, but it achieved a yearly growth rate of 2.6 percent. The fact that the agricultural sector grew at a meager average annual rate of 1.4 percent in the 1988-1995 period is indicative of the serious problems that have been inflicting that sector in the past few years.

The fast increase in domestic demand that had started in the first quarter of 1995 continued through the last quarter. The expected cutback in domestic demand in the last quarter of the year did not materialize due to the early general elections of December 24, and the rate of increase of the expenditure-based GDP ended up being 6.4 percent. Private final consumption expenditures expanded by 8.4 percent in the last quarter of 1995 and the yearly rate of increase remained at 7.6 percent. Expenditures on durable consumer goods, a sub-item of private final consumption expenditures which is most sensitive to changes in income, grew at rate of 20.0 percent in 1995 while it had shrunk by 29.3 percent during the 1994 crisis.

The 6.7 percent rise in the final consumption expenditures of the government can be accounted by the 13.7 increase in the other current expenditures.

Public investment underwent a serious contraction as a result of the 1994 crisis. The share of public investment in GDP, which had remained at a yearly aver-

age of 8.2 percent between the years 1988 and 1993, fell down to 5.5 percent in 1994 and to an even lower 4.2 percent in 1995. Public sector fixed investment had been reduced by the very high rate of 34.8 percent in 1994, and the reduction rate in 1995 was 16.9 percent. The reason of this reduction was the sharp decline in the non-residental construction investment. The increase in total investment in 1995, on the other hand, was 22 percent.

Notwithstanding the cutback in public investment, private sector fixed capital investment rose by 14.9 percent. The increase in the last quarter of the year was 38.8 percent. 73.8 percent of this increase was generated by investment on machinery and equipment. This is indicative of the private sector's outstanding efforts to improve its competitive power on the eve of the Customs Union.

The production expansion of 1995 is slowing down

The rise in interest rates have slowed down the expansion of production in the first quarter of 1996, offsetting the impact of the monetary expansion, the escalation of public expenditures and the salary increases of the civil servants prior to the elections.

The monthly industrial production figures show that the annual industrial growth rate has fallen to 1.8 percent in February from 11.7 percent in January. The growth rate of industry has risen again to 11.4 percent in March. One reason for the rapid fall and rise of industrial production from February to March was the timing of the religious holiday, which had happened to be in March last year and fell on February this year. In view of the decline of the capacity utilization rate, industrial production is expected to slow down in the period ahead. The capacity utilization rate was 80.6 percent in January, and it fell down to 75.1 percent in February and to 70.0 percent in March. The figures for January and March 1995 had been 72.4 percent and 74.7 percent, respectively.

Manufacturing production, on the other hand, has gone up by 10.6 percent in March. The rise in manufacturing production was 11.9 percent in January and a meager 0.7 percent in February. Except for the subsectors of the chemicals and machinery, which together generate the bulk of the manufacturing production, all the other subsectors suffered production losses in February compared with their performances in the same month of 1995. In March, however, production has increased in all the subsectors, except for paper and the chemicals. The rise in the machinery and food sectors has been around 30 percent.

A lasting reduction in inflation can not be realized.

In the previous TÜSİAD report it was predicted that the annual rate of increase in the wholesale price index would be 72.7 percent in the first quarter of the year and 76.7 percent in the whole year, under the assumption that the necessary adjustments in the public sector prices would be made in the first quarter. Due to the delay in the formation of the government, and the resulting suspension of public sector price adjustments, the inflation rate in the first quarter of 1996 turned out to be 64.4 percent. Accordingly, the prediction for the annual inflation rate has been revised down to 75.1 percent instead of 76.7 percent.

The monthly rates of increase of the consumer price index have again fallen below the monthly rates of increase of the wholesale price index, as a result of the price hikes in the public sector. This trend is expected to continue through the coming months, if the slowdown in domestic demand and the adjustments in the public sector prices persist.

An anti-inflationary monetary policy is needed.

The monetary policy, which had been put into effect in 1995, fell behind the targets in the last quarter. The result was monetary expansion, accelerated increases in the exchange rates, losses in the Central Bank reserves, and rises in the interest rates.

By the end of the year the demand for foreign currency was pushed up by the expectation that following the general elections, the negative effects of monetary expansion would be felt, longrestrained public sector price adjustments would be finalized, and a devaluation would be made.

The Central Bank attempted to thwart the increase in foreign currency demand by launching forward foreign exchange sales. The fast depletion of the Central Bank reserves towards the end of the year required a more effective use of the interest rate instrument.

The rising trend in interest rates became most apparent in the Treasury auctions. The sales-weighted compound interest rate rose from 175 percent in November to 180 percent in December.

Uncertainty in the markets was magnified by the election results and by the long deliberations preceding the formation of the coalition government. In the 80

days that elapsed between the December 24 elections and the vote of confidence for the coalition government, no measures were taken. The only policy in this period was the daily operations to meet the financing requirements of the public.

Although there has occurred a fall in the interest rates since the end of January, the auction rates in February and March remained above the 1995 average. While the Treasury was borrowing at 130 percent with a three-month maturity in January, interest on bank deposits with the same term remained 45 points below this rate. This gap has fallen to 18 points in February and to 12 points in March.

Sales-weighted compound interest rates in the Treasury auctions rose from around 204 percent in January to 153 percent in February and the maturity was set to be longer. The formation of the coalition government in March has further dragged the interest rates down to a weighted average of 126 percent. The fluctuations in the interest rates at a time when there has been no significant changes in the economic indicators shows the importance of the risk factor and of the psychological element in the determination of the interest rates.

The amount of the Treasury bonds held by the banks fell from its level of TL 340 trillions in August to TL 258 trillions at the end of December, with the expectation that the interest rates would rise during the election period and that the prices of the bonds would be pulled down. The amount of the Treasury bonds held by the banks has risen again to TL 321 trillions in March, stimulated by the increase in the interest rates.

The Treasury can make use of the short-term advances in accordance with the four-month budget figures. As of the end of March a TL 59 trillion portion of this amount has been used.

The use of the Central Bank resources in financing the public deficit can be confirmed by a look at the Bank's analytical balance-sheet. The cash credits given to the public sector, which comprise almost one third of the assets, has increased by an amount of 99 trillions in the January-March period. Foreign assets has increased by TL 225 trillions. The growth in assets have been financed by the increase in the foreign liabilities totalling TL 222 trillions, in the open market borrowings by TL 30 trillions, and in the reserve money by TL 38 trillions. Another interesting development in the balance-sheet is the decrease in the other items of the assets by an amount over TL 60 trillions. To sum up, in the first three months of the year the Central Bank has generated resources by creating reserve money and by making open market operations. The Central Bank has given

nearly threefourth of this amount as credits to the public sector and used the remaining part for improving its foreign currency position.

A real contraction can be observed by a look at the developments in the money supply as of March 22. The increase in M1 has remained at 5.7 percent, despite the 26 percent rise in the currency in circulation. M2, which comprises the more narrowly defined M1 plus time deposits, has grown by 12.5 percent in the first three months of the year. In the same period, while the interest rates on bank deposits have remained unchanged, time deposits have increased by 22.5 percent in parallel with the rising inflation.

Foreign exchange deposits have exceeded \$21.1 billions as of March 22. The increase has been 23 percent on the dollar base and 97 percent on the TL base compared to the same period of the last year. In the first three months of the year foreign exchange deposits have increased by 8 percent on the dollar base and decreased by 4 percentn on the TL base. The share of foreign exchange deposits in M2Y, on the other hand, rose from its level of 48.5 percent in March 1995 to 51.6 percent in December 1995, and it has come down to 50.6 percent in March 1996. This means that there has been no significant change in FX deposits/M2Y ratio, which has been used as an indicator of currency substitution, since the last year.

In a situation where domestic debt payments are increasing at a spiralling rate while the deepening of the financial markets remains relatively slow, there will be additional difficulties in the financing of the cash requirements of the public.

In the first months of the year the expectations of a high rate of inflation gave further impetus to the increase in the exchange rates. In the first three months of the year, the basket composed of \$1+DM1.5 appreciated by 16.8 percent. However, on the basis of monthly averages, there has not occurred any notable change in the real value of exchange rates in the past threemonth period. In March, the real value of the basket has more or less remained at the level of March 1995.

The credit stock has expanded by 18 percent in the first three months of the year. The increase in the deposit bank credits, however, has been affected by the rising interest rates and has remained at 16 percent. When the comparison is made between December 22, 1995 (the last Friday of 1995) and March 22, 1995, it can be seen that the credit stock has expanded by 32 percent and the deposit bank credits by 31 percent.

The stock exchange proved to be the market which was most sensitive to the political uncertainty prior to and after the elections. The Istanbul Stock Exchange (ISE) composite index, which had closed 1995 at a level of 40,000, rose by 23.6 percent in January following its cyclical movement. The rise in the ISE composite index stopped and then reverted back in a situation of political uncertainty created by the endless efforts to form a coalition government, and it began rising again by the last week of February. The index exceeded the 67,000 level at the end of March.

The ISE composite index increased by 67 percent in the first three months of the year and brought a real return of 35 percent to the investors. The transaction volume, on the other hand, reached the level of 4.8 billions on the dollar base, highest since October 1995.

The deterioration in foreign trade deficit has been caused by the increase in the volume of imports and by the deterioration in the terms of trade.

Foreign trade deficit is particularly noticeable among the problems that has been transferred from 1995 to 1996. The main causes of the growth of the foreign trade deficit were, on the one hand, the increase in domestic demand and, on the other hand, the deterioration of the terms of trade.

Exports grew by 19.5 percent in excess of their 1994 level and reached the total of \$21.6 billions, while imports rose by 53.4 percent to attain the amount of \$35.7 billions. As a result, foreign trade deficit was realized as \$14 billions with a 173 percent increase over its 1994 level, and the export-import ratio fell down to 55.5 percent in 1995 from its higher level of 85 percent in 1994.

The rise in exports was driven by the increase in the industrial exports. The share of the industrial exports in the total exports rose up to 87 percent.

A look at the composition of imports reveals that there were fairly close rates of increase in the imports of consumer goods, investment goods, and raw materials. It should be noted, however, that the greatest increase of 59 percent was realized in the consumer goods, and this was followed by 53 percent in the raw materials and 52 percent in the investment goods.

During the same period both import as well as export prices rose sharply. On the basis of the 12-month averages, the rise in the import prices was 17.2 percent while the corresponding increase in the export prices remained at 13.6 percent. Real increases in exports and imports were therefore much lower. After the adjustment of the price effect, the net increase in exports, based on the 12-month averages, turned out to be 3.8 percent in 1995, and the net figure for the imports was 28.3 percent.

Compared with the year 1993, with a similar \$14 billion foreign trade deficit, imports were higher by 82.4 percent and exports by 41 percent. If the computations are made on the basis of the quantity index, however, the rise in the exports would be found to be 19.2 percent and that of the imports by only 0.7 percent. In other words, measured in terms of the quantity index, foreign trade deficit actually improved by a factor of 20 percent compared with the year 1993.

While the foreign trade deficit was as high as \$14 billions, the current account deficit in 1995 remained at a low \$2.3 billions. In 1993, which had witnessed a similar foreign trade deficit, the current account deficit had been \$6.4 billions. The increases in the transfers and in the other invisibles largely accounted for the lower current account deficit in 1995 relative to 1993.

Among the resources that were used for the financing of the current account deficit there were the \$0.7 billion of direct foreign investment and the \$1.7 billions of portfolio investment; there was no net inflow of other long-term capital; the net shortterm capital inflow remained at the level of \$2.3 billions; and thus total capital movements reached the sum of \$4.3 billions. Together with the \$2.3 billions of unregistered foreign exchange inflow, which was included in the net errors and omissions, the increase in the reserves came to a total of \$4.7 billions.

In 1996 the growth rate is predicted to be 4.5 percent and the foreign trade deficit is expected to rise up to \$16 billions under the impact of the Customs Union. It is expected that the fast increase in 1995 in the revenues from the goods and services, and in particular from tourism, will continue and that the current account deficit will come out to be \$3.8 billions with a 2.2 percent share in GNP. As shown by the medium-term forecasts, included in an appendix with this report, during the next threeyear period the Turkish foreign trade deficit will amount to \$17 billions. The financing of this foreign trade deficit will require the continuation of the fast increase in the invisible revenues.

There is no indication that the real exchange rates appreciated relative to the 1990-1993 period.

Despite the lower deficit in real terms, the reason for the nominal deterioration in the foreign trade deficit was not the loss of competitiveness of the domestic goods relative to the foreign goods; the deterioration was brought about by an increase in the unit price of imports and thereby by a higher amount of payment in return for the same amount of imports. Indeed, the real exchange rates were not at a level that would create problems for exports. The average real value of the foreign exchange basket in 1995 was equal to its average value in the 1987-1994 period.

Beginning with October 1995 the rate of devaluation gained speed and the monthly increases in the exchange rates parallelled the rate of inflation. In 1995 the TL's real appreciation was slower relative to the DM and faster relative to the dollar. In March 1996 the foreign exchange basket of \$1+DM1.5 has appreciated only 3.6 percent in real terms compared to its level in March 1995.

The decline in the Central Bank reserves, which has been in effect since November 1995, has come to a stop and even marked a partial improvement from mid-February to mid-March. The reason behind the end of the decline has been the dissipation of the devaluation expectation with the formation of the new government and the elimination of the foreign exchange demand by the speedy increases in the exchange rates. The Central Bank reserves have begun expanding again, the commercial bank reserves have shrunk down, and the total reserves have remained constant.

Alarming increase in the consolidated budget deficit

The 12 month consolidated budget deficit, which was at a level of TL 317 trillions at the end of 1995, reached the amount of TL 362 trillions in February 1996 and the cash deficit rose up to TL 441 trillions. The 12-month consolidated budget deficit, which had been held at around \$5 billions during the first ten months of 1995, began to rise in November and December. In February 1996 the consolidated budget deficit increased to \$6.7 billions and the cash deficit to \$8 billions. The increase in the budget deficit was brought about to a large extent by payments of interest on domestic debt and personnel expenditures.

While the budget deficit was being financed by short-term domestic borrow-

ing, net foreign debt payments continued. With the persistence on the policy of domestic borrowing, the stock of bonds and bills has risen from TL 1,143 at the end of 1995 up to TL 1,532 trillions in February 1996. In addition to Treasury bonds financing, short-term advances from the Central Bank has been increasingly used since December 1995.

The average interest rate on Treasury bonds, which had been on a rising trend since September 1995, has begun falling in the postelection period with the emergence of a political environment which has been deemed more suitable for the implementation of stabilization measures. The compound interest rate, which touched the high level of 240.3 percent in the first auction of the year, has declined to 125 percent on April 16, thereby falling down to the level of the period prior to the fourth quarter of 1995 when the interest rates had begun rising. However, the 60 percent gap between the inflation rate and interest rate is still too high compared to the 20-30 percent of the period preceding the 1994 crisis. The major factor which is inhibiting the fall in the interest rates is the growing budget deficit and its financing by domestic borrowing.

During the deliberations on the budget, the projected deficit for 1996 has been announced as \$10 billions. In view of the 12month cash deficit of \$8 billions in February, of the continuing rises in the interest payments on domestic debt due to the policy of domestic borrowing, and of the persistent increases in the transfers to the social security organizations, it becomes apparent that the realization of the budget goals of 1996 will preclude any real increases in the personnel and investment expenditures. On the other hand, the consolidated budget deficit, which has usually deviated from the target, has to be held at least at the projected level for 1996 if serious deteriorations are not to occur in the foreign and savings balances. From the perspective of the composition of the total national savings, the financing of a budget deficit in excess of \$10 billions will only be made possible by the rises of the current account deficit and of the private sector savings surplus to levels which are not sustainable in the longterm. It is estimated that in 1996 the current account deficit will approximate \$4 billions. Therefore, the savings pressure on the private sector will be in the amount of \$6 billions. A savings surplus as high as \$6 billions can be realized only in the years of crisis and it can be sustained for only one year. It is expected that, taking economic growth and the Customs Union into consideration, the current account deficit will be on average \$3 billions in the next three years. It is therefore imperative for the budget deficit to be pulled down to the sustainable level of \$5-6 billions.

APPENDIX 1 A MÁCROECONOMIC SCENARIO OF STABLE GROWTH FOR THE 1996-1998 PERIOD

ρ... . 300

Basic characteristics of the transition to a stable growth path:

The aim of this study is to determine, within the framework of a macro-economic model and under certain assumptions, the path that a series of fundamental macroeconomic indicators of the Turkish economy have to follow in the next three-year period, if stable growth is to be attained.¹

For the Turkish economy to achieve macroeconomic stabilty there needs to be a political approach that would end the stop-and-go policies observed between the years 1988-1995. In other words, the main goal should be to follow policies that would gradually put the Turkish economy in the 1996-1998 period on the road towards the long-term growth rate of 6.0 percent.

Certain fundamental conditions have to be fulfilled in order to reach the long-term growth rate. These conditions are:

a) The financing of the foreign trade deficit which is expected to gradually rise up to \$19.6 billion by the end of 1998

It is expected that exports that were in the amount of \$21.6 billions at the end of 1995 will move up to \$28.1 billions by the end of 1998, and that imports will rise during the same period from \$35.7 billions to \$47.7 billions. Therefore, a large proportion of the foreign trade deficit, which will rise up to \$19.6 billions, needs to be compensated for by invisible revenues, and the current account deficit by capital inflows.

Exports rose in 1994, partly as a consequence of the deterioration of the real value of the TL, but mostly because of the contraction of the domestic market. It is observed that this rising trend persisted in the first half of 1995 and that the export drive slowed down in the second half of the year. The revival of domestic demand played an important role in this development. During the 1994 crisis, the contraction of the domestic market was sought to be compensated for by opening up to the foreign markets, and the result was the realization of a significant portion of the existing export potential. For this reason, the Customs Union is not likely to push up the exports in the short term if new investments are not made.

¹The model used in this study is a constrained BVAR (Bayesian Vector Autoregression) model consisting of three blocks with five variables each.

Imports came up to the level of \$35.7 billion in 1995. This was 21.4 percent more than the comparable figure in 1993. The rise in imports is striking, given the fact that the size of the GNP in 1995, measured in constant prices, was only 1.5 percent greater than its level in 1993. However, the increase in imports was nearly completely accounted for the increase in the import prices. According to the foreign trade quantity index, the 1995 imports exceeded that of 1993 by only 0.7 percent. One factor that stimulated imports in both 1993 and 1995 was the rapid rise in private sector investment. A large portion of the import rise was accounted for by the investment drive of the private sector, which was striving to enhance its competitiveness before joining the Customs Union. It is estimated that the increase in private sector investment, and with it the rising trend in imports, will continue in 1996.

The share of the foreign trade deficit in GNP, which had remained at an average annual level of 5.3 percent between the years 1988-1993, rose up to 8.6 percent in 1995. It is predicted that this ratio will grow up to an historically high level of 10.2 percent in 1998.

There is the need of the financing of the foreign trade deficit which will be generated by the rise in imports, which themselves are necessary for the investments that will enhance the competitive power of the economy. In order to achieve this goal, the invisible revenues must be increased at a faster rate. If the invisible revenues follow the rising trend of the last years, it can be safely expected that the financing of the foreign trade deficit will not run across any serious bottleneck. The increase in the invisible revenues was the factor behind the fact that although the foreign trade deficit of 1995 was only \$1.0 billion lower than that of 1993, the current account deficit in 1995 was lower than the comparable figure of 1993 by the much larger margin of \$4.3 billions.

Another important development concerning the financing of the foreign trade deficit is related to the developments in terms of trade. From the beginning of 1994 through September 1995, as the import prices rose sharply, the terms of trade deteriorated contributing to the high foreign trade deficits in nominal terms. If the terms of trade improve, this will ease the burden of the financing of the foreign trade deficit.

It is estimated that, notwithstanding the increase in the invisible revenues, the next three years will witness current account deficits. This deficit will have to be financed by capital inflows. Net long-term and short-term capital movements,

which had amounted to \$9.0 billions in 1993, fell down to \$4.7 billions in 1995. On the other hand, 1995 was a much more favorable year in terms of the rises in the foreign exchange reserves. The increase in the foreign exchange reserves had been only \$308 millions in 1993, and the figure for 1995 was \$4.7 billions. This development was to a large extent produced by the rise in the net errors and omissions, from a low \$-2.2 billions in 1993 to \$2.3 billions in 1995.

It is expected that by 1996 there will be increases in the net capital inflows. If the macroeconomic balances can be maintained, the Customs Union will exert a very positive effect on the direct as well as portfolio investment.²

b) Raising the share of the budget revenues in GNP from 20 percent to 24 percent

The size of the public deficit constitutes by far the major obstacle which is blocking the Turkish economy from advancing towards macroeconomic stability. Revenue increasing measures have to be urgently taken if the deficit is to be reduced. In the 1996-1998 period the share of the budget revenues in GNP will have to be raised from 20 percent to 24 percent by means of revenues from taxation and in part from privatization.

Tax revenues have to be raised by way of expanding the tax base. Turkey ranks lowest among the OECD countries in terms of the share of the tax revenues in GNP.

The swift implementation of the privatization program will make a positive contribution to the increase in revenues. Privatization will be particularly helpful in closing the deficit which has been brought about by the deficits of the SEEs and which is now constituting some 25 percent of the public sector borrowing requirement.

c) Reducing the consolidated budget deficit from its expected level of 6.4 percent of GNP in 1996 to 3.1 percent of GNP in 1998

Budget deficit must be cut back if the private sector savings are to be channelled to investment and if the private sector is to borrow from the financial markets at more favorable rates. In line with this target, expenditure cutting measures must be formulated, in addition to the policies that are aimed at increasing rev-

² Developments in the foreign trade and capital movements in the case of Spain, which has joined the Europen Community in 1986, is summarized in the Appendix 2.

enues. A look at the budget expenditures in the last two years provides enough proof that the prospects of effecting real reductions in the investment and personnel expenditures are very limited. Any reduction in the expenditures will likely to come from the cuts in the transfers. For this reason, new regulations in the area of social security appear as important as privatization. Interest payments constitute the largest portion of the transfers. The share of interest payments in budget expenditure had remained at an average level of 21.2 percent in the 1988-1993 period, and it rose up to 34 percent in the years 1994-1995. This rapid escalation was the outcome of the increases in the payments of interest on domestic debt. A sound and sturdy structure must be devised for the financing of the Treasury if this harmful development is to be stopped.

One of the most important findings of this study is that a fast moving inflationary process will definitely set in if the consolidated budget revenues and the consolidated budget expenditures are not brought to the desired levels. The consolidated budget deficit/GNP ratio will come out to be 6.4 percent in 1996 according to the most optimistic estimations, and if the ratio remains at this level in the coming years this will conflict with the requirements of a stable growth process.

d) Reducing the growth of reserve money, which is strongly and positively correlated with inflation, to 45 percent by the end of 1998

The rate of increase in the reserve money must be pulled down if the rate of inflation is to be reduced. A necessary condition of this is to cut back the use of the short-term advances in the financing of the budget deficit. Measures will have to be taken that would push down the consolidated budget deficit/GNP ratio to the desired levels, discount the significance of resorting to the shortterm advances in financing the deficit, and improve control over monetary expansion.

Results that will be obtained if the assumptions of the scenario come to be true

The following results will be obtained if the assumptions of the scenario come to be true:

1) The rate of growth will gradually increase and reach the long-term trend value of 6.0 percent after 1998.

- 2) The rate of inflation will be reduced from 90s percent to 40s percent.
- 3) Real interest rate will be reduced from 20s percent to around 6 percent.
- 4) Real exchange rate will be stabilized.³
- 5) Capital movements will increase.

The final word of this study is that steps must be taken in the year 1996 for achieving the goal of structural transformation if Turkey is to settle firmly on the road of stable growth.

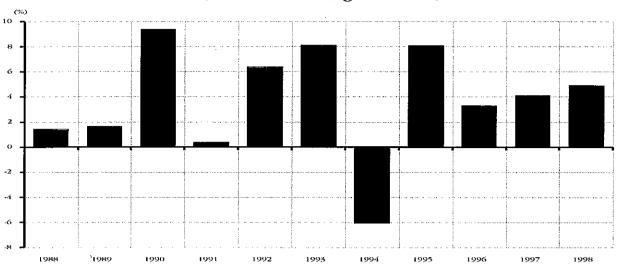

³ A seemingly contradictory element in this scenario is the fast reduction in the real interest rates in a situation where stabilization measures are being implemented. Three developments are to be mentioned that exert some effect on this process. The first development is the decrease in the borrowing requirement with the increase in budget revenues. The second is the near stability of the real money supply. The third, and perhaps the most important development is the decrease in the risk premium in the financial markets as a result of the measures that are being put into action.

APPENDIX 2 FOREIGN TRADE AND CAPITAL MOVEMENTS IN SPAIN IN THE AFTERMATH OF EC MEMBERSHIP

 Spain experienced very high levels of foreign trade deficit after her accession to the European Community in early 1986. Spain's foreign trade deficit, which was \$4.8 billions at the end of 1985, gradually increased until 1992 and finally reached the level of \$30.4 billions. The reduction in imports in 1993 and the surge in exports in 1994 pushed down the foreign trade deficit in these two years to around \$14.8 billions.

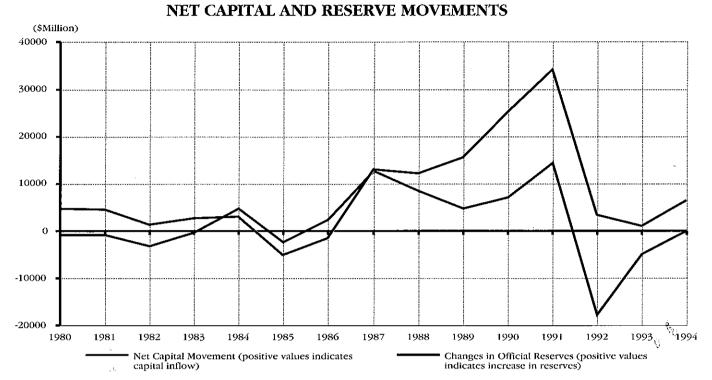

In the 1986-1989 period, swift rises in the income from the services and transfers stopped the further deterioration of the current account balance. The current account balance scored a surplus of \$2.8 billion in 1985 and \$3.9 billion in 1986. In the years 1987 and 1988, however, the current account balance showed deficits of \$0.3 billion and \$3.8 billions, respectively. In 1989, when the increase in the invisibles came to a halt, the deterioration of the foreign trade deficit was completely reflected upon the current account deficit and the current deficit rose up to \$10.9 billions. In 1990, the invisible revenues began to fall, with the consequence that the deterioration of the current account deficit went beyond the deterioration of the foreign trade deficit. No improvements in the invisibles income were witnessed in 1991 and 1992, and as a result the current account deficit continued to rise and reached the level of \$21.3 billions in 1992.

The rapid depreciation of the Spanish Peseta following the September 1992 crisis in the ERM was highly effective in the curtailment of the foreign trade deficit. Imports fell down from their 1992 level of \$96.2 billion to \$77.0 billion in 1993; the decline in exports from 1992 to 1993 was only \$3.8 billions; and as a result the foreign trade deficit, which had been at a level of \$30.4 billions in 1992, decreased to \$15 billions in 1993. With this quick improvement in the foreign trade deficit, the current account deficit reverted back to \$5.8 billions in 1993.

What is notable in the case of Spain is that, with the accession to the EC, the net services income rapidly increased through 1989 and remained at that high level thereafter. As the net transfers were also on a rising trend in this initial period, there occurred only a limited deterioration in the current account deficit until the year 1989.

One advantage of the EC membership for Spain was the high amounts of capital inflows. Although the current account deficit regularly increased between the years 1987-1991, the official foreign exchange reserves exhibited a continual expansion in this same period. Very high levels of capital inflows in the form of direct investment and portfolio investment contributed to the financing of the current account deficit as well as to the growth of the reserves. In 1992 and 1993 on the other hand, decreases in direct investment, coupled with net other long-term capital outflows, led to a relative shrinking of the reserves.
